

Mimoto Continuous CAPTCHA

Stop agent and bot infiltration. Divert only the AI agents and bots pretending to be people, with nothing for real people to do.

OVERVIEW

Increasingly, we rely on AI agents to perform tasks. They make people more productive, save time, and often bridge a skills gap that would not have been possible even a few years ago.

Unfortunately, as AI agents take on more human tasks, cybercriminals have turned to them to impersonate people, to gain access to systems or commit fraud.

Mimoto, the creator of Continuous Verification, now offers the next generation of Continuous CAPTCHA. **Mimoto Continuous CAPTCHA (MCC)** diverts only the agents and bots attempting to get in through your public-facing website, such as CRM forms and checkout.

WHAT IT DOES

One clear call

Every entry gets one answer: person or agent.

The input, not the words

It looks at how each entry is put together, not at what it says.

No profile needed

It works on anyone who fills in your form. Nobody has to be known in advance.

Nothing for people to do

It runs in the background. People are never prompted, and it does not affect page load times.

WHAT HAPPENS ON EVERY SIGN-UP

1. Sign-up

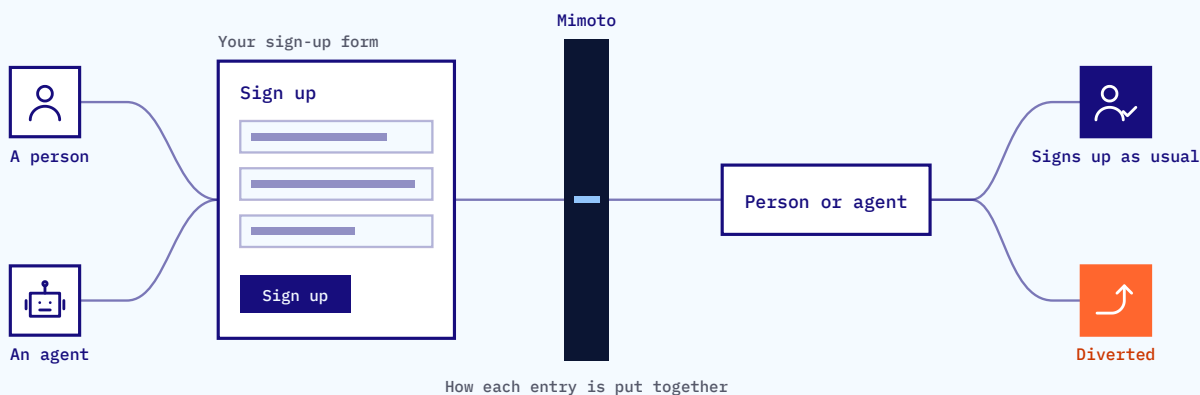

Anyone can fill in the form

2. The call

Person or agent

3. The result

People go through, agents are diverted

A person and an agent can fill in the same form with the same details. MCC makes one call on each: the person signs up as usual, and the agent is diverted. Illustration only.

Sometimes, the best user experience is when the user doesn't know you're there.

MCC delivers high impact with no friction. It operates in the background. Users are never prompted, and it is so lightweight that it does not affect page load times.

What you get

01

Real-time detection and diverting

For attempts to create accounts, download assets, access data, and complete registrations.

02

Integration APIs and tools

For website implementation.

03

Analytics and reporting dashboards

04

Customer support and documentation

Where it works

On the parts of your website anyone can use, where agents get in by pretending to be people:

- Registration and sign-up forms
- CRM forms, such as contact and lead forms
- Asset downloads and access to data
- Checkout

Inside your systems, Mimoto Continuous Verification confirms the right person, all session long.

With Mimoto, good agents can do what agents do best, giving your customers more productive experiences on your website or app, while bad agents are stopped from defrauding you and your customers.

ABOUT MIMOTO

Is this a real human? Is it the right human?

Mimoto provides person-based continuous verification. It recognizes and responds in real time when a user is impersonated by a person or an agent, a session is taken over, or a credential is shared or compromised.

See Mimoto Continuous CAPTCHA at your sign-up forms.
